Pan−cancer SMC5/6 module landscape across local single−cell cohorts

Pan−cancer evidence from four independent cohorts; full−transcriptome UMAPs shown separately, with within−cohort gene scores

Four exact−coverage cohorts: 444,603 cells, 79 verified donors plus 58 GSE131907 samples without donor IDs. Existing full−transcriptome coordinates are reused. Symmetric plot padding prevents clipping; clusters are not shifted. UMAP geometry is descriptive; edge placement is not a biological conclusion. EID3 is excluded from modules. LUAD CellxGene has zero detected N
